§17 Provenance & Methodology

Why this beats the HouseCanary MCP report: land/zoning pairing + county-specific clearance priors, not a generic AVM.

Verdict/value-estimate math is a deterministic prior/anchor framework (county clearance priors + prior sale + judgment ratio), NOT the ML model. A single XGBoost v14.0 classifier (72.2% accuracy, 0.7834 AUC, trained 2026-05-27) additionally scores third-party-purchase probability as a directional signal in context_layers.ml_model — this is informational, not the deal verdict driver.

n(sold/FJ)=36, median=0.521, p25=0.432, p75=0.653
